Project Name	Machine Learning—Based Credit Card Approval Prediction System
Maximum Marks	4 Marks

Empathy Map

Introduction

Logs into the application. Enters personal and financial information. • Uploads required application details. • Submits the application for prediction. • Reviews the prediction result. • Updates information if	• Anxious while waiting for the result. • Concerned about financial eligibility. • Confident when receiving clear predictions. • Satisfied if the process is quick and transparent.	
User Goals • Fast approval prediction • Accurate prediction • Secure personal information • Transparent decision pmcess	Pain Points • Ixngthy manual approval procedures • Lack of transparency • Delayed • Confusing eligibility requirements	System Opportunities • Intelligent Machine Learning on • Faster processing • Consistent approval decisions • Improved customer experience

- Easy application submission
- Better financial planning

- Fear of application rejection
- Repeated document verification

- Secure digital application
- Transparent prediction results
- Reduced manual effort

The Empathy Map helps understand the needs, expectations, thoughts, behaviours, and emotions of a credit card applicant interacting with the Machine Learning—Based Credit Card Approval Prediction System. It provides valuable user insights that support the design Of an intelligent, user-friendly, transparent, and efficient credit card approval process.

Conclusion

The Empathy Map identifies the expectations, behaviours, concerns, and emotions Of credit card applicants throughout the approval process. These insights help design a Machine Learning—Based Credit Card Approval Prediction System that is user-centric, efficient, transparent, secure, and capable Of delivering accurate approval predictions while improving the overall customer experience.
